

Survey - Practitioner's Perspective on the MVN+ of Vulnerability Management in Maven Ecosystem

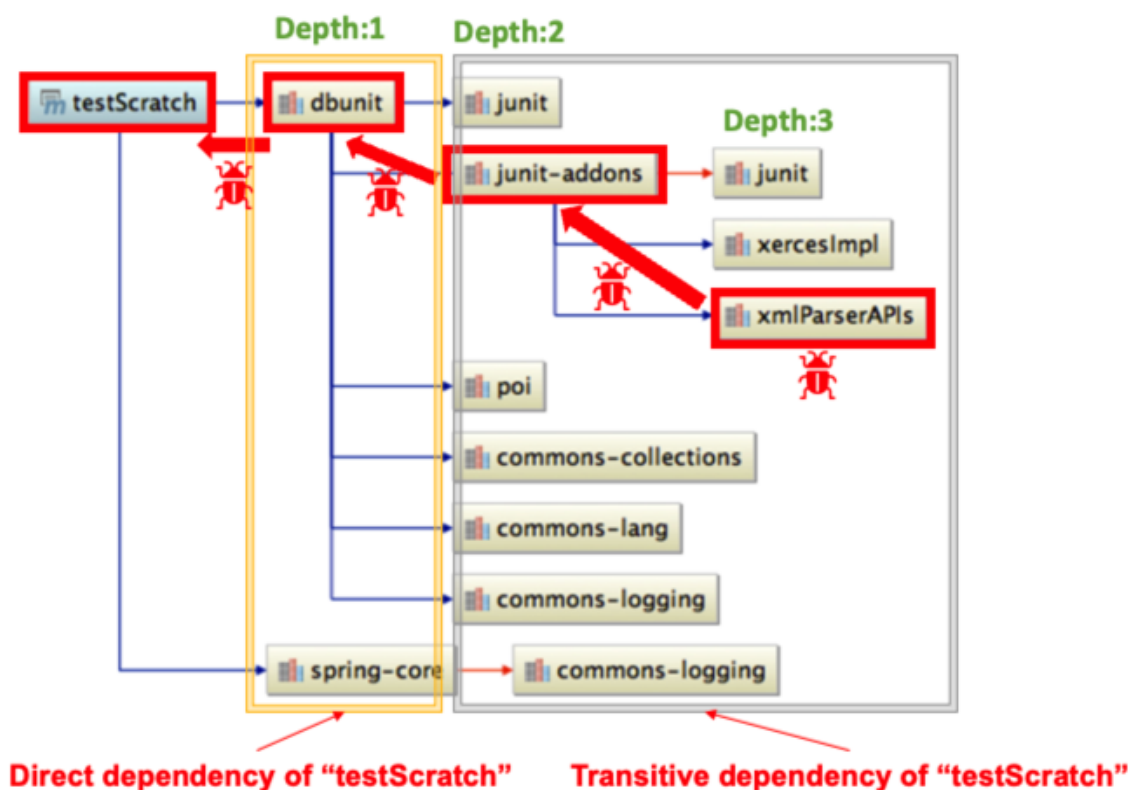

Dear Participant,

We are conducting a survey to understand practitioners' perceptions of vulnerability management in the Maven ecosystem. We are providing a vulnerability management tool, **MVN+**, and comparing it to the existing public platforms [the Maven Repository](#) and [the Open Source Insights](#). This survey will take you around 10 minutes.

Background

Modern software often reuses functionality from other software libraries (i.e., dependencies) to provide a full working system. For Java projects, the Maven plays the central role of a software supply chain to manage software reuse.

Vulnerability propagation in the supply chain

The figure above is an example of a Maven project "testScratch".

- The dependency in the **yellow** box and the **gray** box are direct dependency and transitive dependency of "testScratch", respectively.

- If we found a vulnerability from the dependency “**xmlParserAPIs**”, the vulnerability would **propagate** from the dependency chain to the project “**testScratch**”.

Although software reusing provides great convenience to developers, there are also potential risks related to the quality of the dependencies.

For developers, it's hard to know all vulnerabilities from downstream dependencies. Even if they collect all the downstream vulnerabilities, it is also hard to order the list of vulnerabilities. We believe that dependencies with greater depth may be less likely to be used, so vulnerabilities from deep dependencies may have a lower impact. And different vulnerability severity ratings will also affect the importance of vulnerabilities.

So, for the developers who reused other libraries, they will try to avoid the vulnerabilities impacting the whole project.

Current state-of-the-art in Vulnerability Management

There are two platforms that provided the vulnerability information of libraries: **Maven repository** and **Open Source Insights**.

We found **Maven repository** and **Open Source Insights** have many limitations in practice. So we are designing a new approach **MVN+**. We compare them in the following parts.

Below, there are three links showing the vulnerability management result one library (org.apache.spark : spark-core_2.11 : 1.2.2) on **Maven Repository**, **Open Source Insights** and our tool **MVN+**.

[Maven Repository result of library \(org.apache.spark : spark-core 2.11 : 1.2.2\)](#)

[Open Source Insights result of library \(org.apache.spark : spark-core 2.11 : 1.2.2\)](#)

[MVN+ result of library \(org.apache.spark : spark-core 2.11 : 1.2.2\)](#)

This library is the example we used in this questionnaire. You can click to visit each link to get the full results for the library on each platform. We also provide screenshots of relevant parts in the questions below.

The main goal of this survey is to investigate:

- (1) **user satisfaction** of three platforms;
- (2) examine the **importance** of each aspect;
- (3) **user feedback** on our approach.

We will not reveal your identity in any form of the research outcomes. All of the information provided in the survey will be used for research purposes only. We sincerely appreciate your participation in our study.

Part 1: Information about the Participant

In this part, we will ask you for some background information related to your role and experience.

For each question, please type your answer in the corresponding area.

Q1: Which of the following best describes your primary job role?

- A. Developer B. Algorithm engineer C. Test engineer D. Project manager
E. Researcher F. Data analyst G. Other (Please specify below)

Answer: A,F,E

Q2: How many years of experience do you have in software development/software maintenance/programming?

Answer: 3 years

Part 2: Vulnerability Listing

Maven Repository shows the IDs and the total number of vulnerabilities from each dependency. If you want to know details of the vulnerabilities, you should click the link and go to the homepage of the dependency library (e.g., go to **netty-all** to find the details).

[Home](#) » [org.apache.spark](#) » [spark-core_2.11](#) » [1.2.2](#)

**Spark Project Core » 1.2.2**
Core libraries for Apache Spark, a unified analytics engine for large

MORE DETAILS

=====

MVN+ shows a list of dependencies and their associated vulnerabilities grouped by different dependency types (e.g., direct vs transitive).

Direct Compile Dependency (39) (Priority:CRITICAL) Directly used			
Depth	Group / Artifact	Version	Vulnerabilities
1	log4j » log4j	1.2.17	CVE-2019-17571 (9.8) CVE-2022-23305 (9.8) CVE-2022-23302 (8.8) CVE-2021-4104 (7.5)
1	org.eclipse.jetty » jetty-server	8.1.14.v20131031	CVE-2017-7657 (9.8) CVE-2017-7656 (7.5) CVE-2015-2080 (7.5) CVE-2019-10241 (6.1) CVE-2019-10247 (5.3) CVE-2021-34428 (3.5)

Direct Test Dependency (10) (Priority:LOW) Only be used In test scope			
Depth	Group / Artifact	Version	Vulnerabilities
1	junit » junit	4.10	CVE-2020-15250 (5.5)
1	asm » asm	3.3.1	
1	com.novocode » junit-interface	0.10	

*** Note:** By default, test dependencies *will not* be included in the final binary. Hence, MVN+ shows that vulnerabilities in test dependencies have a low priority.

Q3: On a scale of 1 (negative) to 5 (positive), how would you rate Maven repository's vulnerability listing approach?

Answer: 3

Feedback (optional): Does not localize vulnerable code. Developers need to do some digging.

Q4: On a scale of 1 (negative) to 5 (positive), how would you rate Open Source Insights' vulnerability listing approach?

Answer: 3

Feedback (optional): Doesn't really list meaning behind severity level.

Q5: On a scale of 1 (negative) to 5 (positive), how would you rate MVN+'s vulnerability listing approach?

Answer: 4

Feedback (optional): Lots of great information, but there may be better ways to summarize. For example, I don't understand the relationship between color quote and priority.

Q6: On a scale of 1 (negative) to 5 (positive), how useful is listing every single vulnerability that is **from each dependency** helpful for developers (e.g., DependencyA has Vulnerability1 and Vulnerability2)?

Answer: 5

Feedback (optional): Only useful if it is actually used in the code.

Q7: On a scale of 1 (negative) to 5 (positive), how useful is grouping the dependencies/vulnerabilities based on dependency scope (e.g., direct dependency and test dependency)?

Answer: NAN

Feedback (optional): Not sure what is the difference between the direct vs test dependency.

Part 3: Vulnerability Severity Score and Ranking

Maven Repository only shows the vulnerability from direct dependencies (**depth=1**) and does not show the vulnerability severity score. If you want to know the details of the vulnerabilities, you need to click the link and go to the homepage of the dependency library (e.g., go to **netty-all** to find the details) and search based on the CVE ID for the severity score by yourself.

Network Framework Apache 2.0	io.netty » netty-a	2 vulnerabilities	4.0.23.Final	4.1.79.Final
Logging Apache 2.0	log4j » log4j	4 vulnerabilities	1.2.17	2.18.0

Home » io.netty » netty-all » 4.0.23.Final

 **Netty/All In One » 4.0.23.Final**
Netty is a NIO client server framework which enables quick and easy

Repositories	Central BeDataDriven Redhat GA Sonatype
Ranking	#180 in MvnRepository (See Top Artifacts) #1 in Network App Frameworks
Used By	2,278 artifacts
	Direct vulnerabilities: CVE-2019-16869 CVE-2016-4970

=====

Open Source Insights shows the vulnerability from direct dependencies (**depth=1**) and transitive (**depth>1**) dependencies. OSI does not show the dependency depth information. OSI ranks the vulnerabilities by severity score (as illustrated below by the red arrow).

Low severity vulnerability that affects org.apache.spark:spark-core_2.10 and org.apache.spark:spark-core_2.11
9.8 CRITICAL · GHSN-phg2-9c5g-m4q7 [MORE DETAILS](#)

High severity vulnerability that affects org.apache.spark:spark-core_2.10 and org.apache.spark:spark-core_2.11
7.8 HIGH · GHSN-phc-48pp-52gr [MORE DETAILS](#)

Sensitive data written to disk unencrypted in Spark
7.5 HIGH · GHSN-phj-3fpf-mhj5 [MORE DETAILS](#)

Low severity vulnerability that affects org.apache.spark:spark-core_2.10 and org.apache.spark:spark-core_2.11
4.7 MEDIUM · GHSN-A-6mq-8r44-vmjc [MORE DETAILS](#)

Moderate severity vulnerability that affects org.apache.spark:spark-core_2.10 and org.apache.spark:spark-core_2.11
6.1 MEDIUM · GHSN-A-r34r-f84j-5x4x [MORE DETAILS](#)

Moderate severity vulnerability that affects org.apache.spark:spark-core_2.10 and org.apache.spark:spark-core_2.11
4.2 MEDIUM · GHSN-w4r4-65mg-45x2 [MORE DETAILS](#)

MVN+ shows the dependencies ranked by dependency depth. Then, MVN+ ranked the dependency based on the highest severity score.

Depth	Group / Artifact	Version	Vulnerabilities
3	net.sourceforge.htmlunit » htmlunit	2.14	CVE-2020-5529 (8.1)
3	org.apache.httpcomponents » httpclient	4.3.2	CVE-2014-3577 (5.8) CVE-2020-13956 (5.3) CVE-2015-5262 (4.3)
3	commons-io » commons-io	2.4	CVE-2021-29425 (4.8)
4	commons-collections » commons-collections	3.2.1	CVE-2015-6420 (7.5)
4	xerces » xercesImpl	2.11.0	CVE-2012-0881 (7.5) CVE-2022-23437 (6.5)
4	com.google.guava » guava	15.0	CVE-2018-10237 (5.9) CVE-2020-8908 (3.3)
5	org.eclipse.jetty » jetty-io	8.1.14.v20131031	CVE-2021-28165 (7.5)

Q8: On a scale of 1 (negative) to 5 (positive), how would you rate Maven repository's vulnerability listing approach?

Answer: 4

Feedback (optional): I like that it's simple. Doesn't clutter my view.

Q9: On a scale of 1 (negative) to 5 (positive), how would you rate Open Source Insights' vulnerability ranking approach?

Answer: 3

Feedback (optional): I don't really understand how severity score is rated.

Q10: On a scale of 1 (negative) to 5 (positive), how would you rate MVN+'s ranking approach?

Answer: 4

Feedback (optional): It has great information. However, let's say there is vulnerability in depth=5. Shouldn't we leave the job of fixing this vulnerability to the software component that directly depends on this?

Q11: On a scale of 1 (negative) to 5 (positive), how is *depth* and *rank of dependency by depth*, helpful for developers?

(e.g.,

- (1) {Dependency A (depth=2) [CVE-1 (9), CVE-2 (5)]},
- (2) {Dependency B (depth=3) [CVE-3 (9.8)]},
- (3) {Dependency C (depth=3) [CVE-4 (8), CVE-5 (6)]}

)

Answer: NaN

Feedback (optional): Let's say there is vulnerability in depth=5. Shouldn't we leave the job of fixing this vulnerability to the software component that directly depends on this?

Q12: On a scale of 1 (negative) to 5 (positive), how would you rate the *ranking of vulnerabilities by their severity score*? (e.g.,

- (1) CVE-3 (9.8)
- (2) CVE-1 (9)
- (3) CVE-4 (8)
- (4) CVE-5 (6)
- (5) CVE-2 (5)

)

Answer: 5

Feedback (optional): However, I don't understand how it's actually scored, which makes me skeptical. Also, the relationship between priority and severity is confusing.
